ProjectPro

In simple terms:

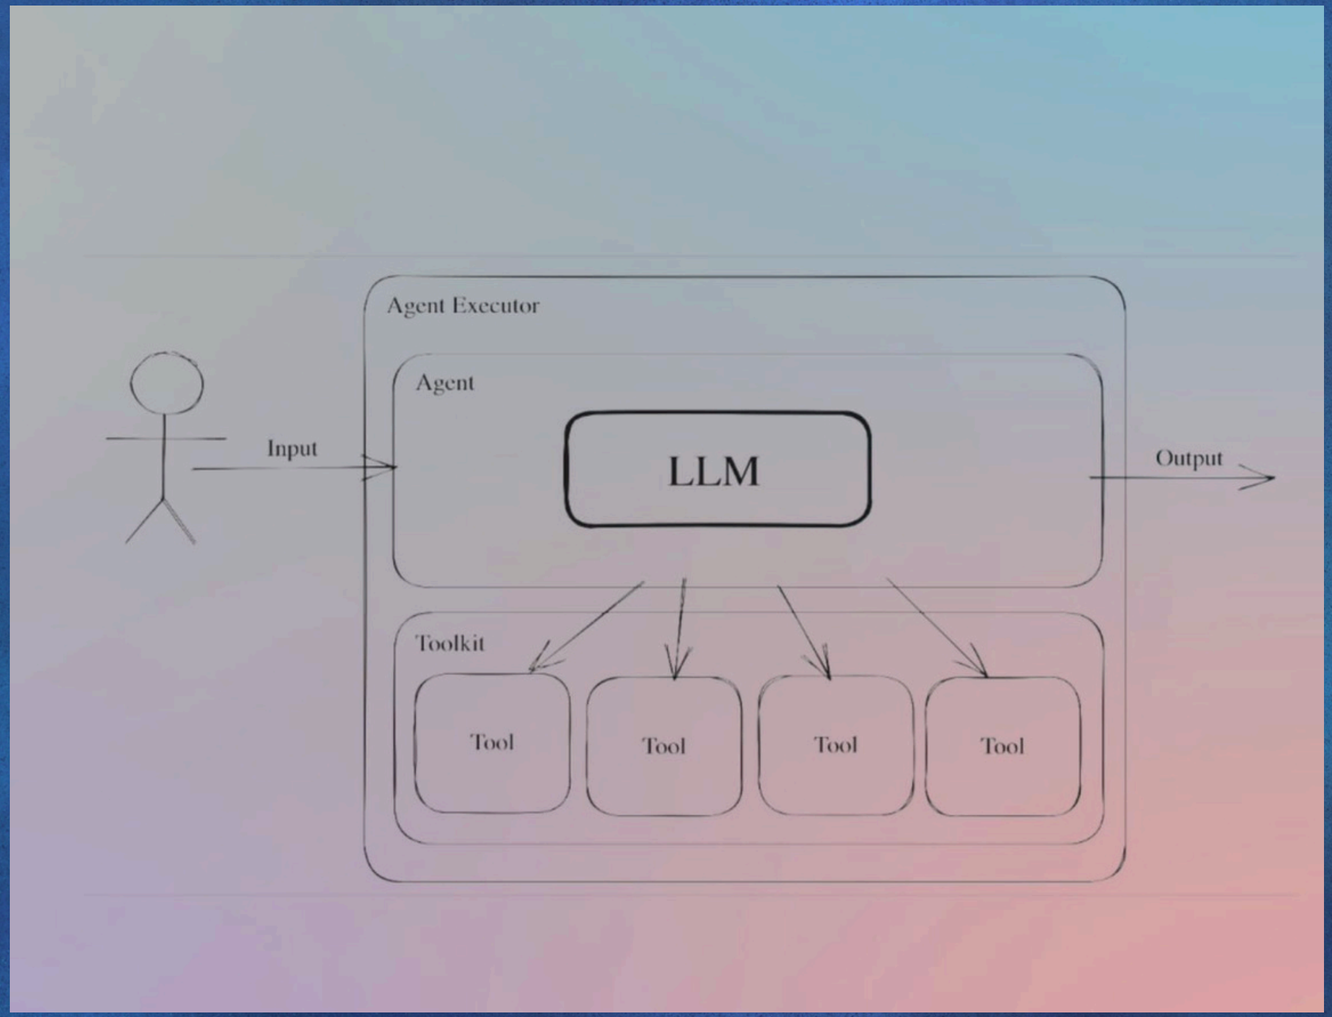

"In simple terms, you can think of a LangChain system like a human body:

- The LLM is the brain — it understands, reasons, and decides what needs to be done.
- The Agent is the hands and legs — it takes actions based on the brain's decisions.
- The Tools are the instruments — like a calculator, a search engine, or a script runner, that the agent uses to actually perform tasks.

So, the LLM thinks, the Agent acts, and the Tools execute."
